Same Patient, Two Look-Up Tables:

Novice (vital → normal range) vs. Expert (gestalt → catch sepsis early)

Figure source: GitHub Copilot (Claude Opus 4.8), generated 2026-08-14 (v1.0). Diagram authored by the model; any errors are its own.

Post-op patient, hour 18

Slightly fast heart & breathing, mildly confused, "just doesn't look right"

one vital at a time

whole-patient gestalt

Novice Nurse

Novice Look-Up Table
one row per single vital

Isolated Vital	In-Range? → Action
Heart rate 104	Just under alarm → chart it
Resp. rate 22	Borderline → chart it
Temp 37.9°C	Not yet febrile → chart it
BP 108/64	Still "normal" → chart it
... each number read alone	... wait for a threshold to trip

Outcome

No single alarm fires; sepsis caught late → failure to rescue

Experienced Nurse

Expert Look-Up Table
one row per recognized gestalt

Recognized Pattern	Read → Action
Creeping HR+RR + new confusion + mottling	Early sepsis → escalate, cultures, fluids
Warm skin, low urine output, off feeling	Perfusion failing → lactate, call MD
Small trend across several vitals at once	Trajectory is bad → act before alarm
... a few high-value gestalts	... rescue while there is time

Outcome

Sepsis bundle started early; patient stabilizes, rescued
